STABILITY OF THE BOUNDARY STABILISED INTERNALLY DAMPED WAVE  
EQUATION  $y'' + \lambda y''' = c^2(\Delta y + \mu \Delta y')$  IN A BOUNDED DOMAIN IN  $R^n$  1-15
- Abstract:** The boundary stabilization of the problem satisfying the differential equation  $y'' + \lambda y''' = c^2(\Delta y + \mu \Delta y')$ ,  $0 < \lambda < \mu$ , in a bounded domain  $\Omega$  in  $R^n$  with smoothing boundary  $\Gamma$  is studied. Such equations arise in the vibrations of flexible structures possessing internal material damping and modeled by the “Standard linear model” of viscoelasticity. Explicit exponential energy decay rate is obtained for the solution of the above problem subject to mixed boundary conditions.

ČECH-STONE QUOTIENT FUNCTIONS 17-24
- Abstract:** The main properties of a particular class of  $T_0$  quotient functions are studied. It is demonstrated that these functions preserve Baire spaces, compactifications and the order relationships of the latter. Finally it is shown that these functions provide one solution to a problem raised by A. Wilansky.

ON A GENERALIZED USEFUL MEAN CODEWORD LENGTH FOR  
THE BEST 1:1 CODE 25-33
- Abstract:** In the present paper we consider  $\beta$ -generalization of the exponential useful mean codeword length for the best 1:1 codes studied by Priti and Tuteja [7] and obtain its lower bounds in terms of the generalized ‘useful’ information measure of order  $\alpha$  and type  $\beta$  and the exponential useful mean codeword length of uniquely decodable codes.

MATRIX TRANSFORMATIONS AND ALMOST BOUNDEDNESS 35-42
- Abstract:** The main purpose of this paper is to determine the matrices of the classes  $(l(p, s), \hat{m}(r))$ ,  $(l(p, s), b\hat{s}(r))$ ,  $(c_0(p, s), \hat{m}(r))$  and  $(c_0(p, s), b\hat{s}(r))$ . Additionally some new results have been obtained as special cases.

FUNCTIONS OF  $L$ -BOUNDED INDEX AND OF NONUNIFORM  
 $L$ -BOUNDED INDEX 43-57
- Abstract:** We study the properties of entire functions of  $L$ -bounded index and of nonuniform  $L$ -bounded index.

THE  $\alpha$ -REMOTE POINTS IN  $\beta X$  FOR A DISCRETE TOPOLOGICAL  
FIELD  $X$

59-65

**Abstract:** The concept of  $\alpha$ -remote points is introduced in  $\beta X$ , the Stone-Ćech compactification of the discrete topological field  $X$ , where,  $\omega \leq \alpha \leq |X|$ . The arithmetic in  $\beta X$  is applied to this space of  $\alpha$ -remote points and using the extended operations, the solutions to some equations are obtained in this space.

FREE CONVECTION FLOW OF A VISCOUS INCOMPRESSIBLE FLUID IN POROUS  
MEDIUM BETWEEN TWO LONG VERTICAL WAVY WALLS

67-86

**Abstract:** The flow of a viscous incompressible fluid in porous medium confined between two long vertical wavy walls has been studied under the assumption that the wave length of the wavy walls is large. The amplitudes of the two wavy walls considered are different. The governing equations have been solved using regular perturbation technique, taking ' $\lambda$ ' as the perturbation parameter, where ' $\lambda$ ' inversely proportional to the wave length. Expressions for dimensionless velocity, temperature and shearing stress at both the walls have been obtained and numerically worked out for different values of the parameters involved in the solution. The boundary conditions used by Vajravelu and Sastri [6] and the subsequent expression for the skin friction coefficient at the wavy wall obtained by them is corrected.

A NOTE ON WEAK SEMI-CONTINUITY

87-90

**Abstract:** Malghan and Iyengar [10] introduced and investigated the notion of weak semi-continuity. In this note, we further investigate some more properties of this type of continuity.

GENERALIZATION CONCERNING INCLUSION THEOREMS FOR ABSOLUTE  
HARMONIC-CESÀRO METHOD OF SUMMATION

91-96

**Abstract:** In this paper we generalize inclusion theorems for absolute summability methods  $|Z, \alpha, \beta|$  established by Das and Mohapatra to  $|Z, \alpha, \beta, |k, k \geq 1$ .

GENERALIZED DENSITY FUNCTIONS IN A TOPOLOGICAL GROUP

97-111

**Abstract:** In this paper we generalise the notion of density of sets and density topology in a topological group  $X$  with the help of a suitable hereditary ring of subsets of  $X$ .
